'DATA COLLECTION DESCRIPTION

The Survey of Inmates of State Correctional Facilities, 1979 was one of a series of data-gathering efforts undertaken during the 1970's to assist policymakers in assessing and overcoming any deficiencies in the Nation's correctional institutions. During that decade, an unprecedented growth in the number of people subject to custody imposed increasingly heavier demands on already strained institutions. Intensified by overcrowding, the deterioration in living conditions among the incarcerated helped spur public authorities, especially the judiciary, to take remedial action. Decisions rendered by state and Federal courts have required the adoption of measures to alleviate overcrowding and otherwise improve living conditions in correctional facilities. Against this background, the Bureau of Justice Statistics has conducted surveys of Federal, state, and local correctional facilities to determine existing conditions and to predict future needs.

Designed to complement the Census of State Adult Correctional Facilities, 1979 undertaken simultaneously, the Survey of Inmates of State Correctional Facilities, 1979 gathered extensive information on demographic, socio-economic, and criminal history characteristics. Also obtained were details of inmates' military service records such as era and branch of service, eligibility for benefits, type of discharge, and contact with veterans' groups. Other variables include age, ethnicity, education, life-time drug use, drinking pattern prior to arrest, prior incarceration record, and prearrest annual income. There are a total of 993 variables. All information was provided by inmates who participated in personal interviews on a voluntary basis.

The data are in a single file with 11,397 records and a logical record length of 1959 characters per record.

DATA COLLECTION PROCEDURES

The survey was conducted by personal interview during October and November 1979 by the U.S. Bureau of the Census for the Bureau of Justice Statistics. Original survey specifications required a sample totaling 12,000 inmates (9,500 male and 2,500 female) and approximately 215 state correctional facilities. The sample was selected

independently from the two sample frames of male and female inmates. Within each frame, the sample design is a stratified two-stage selection with probabilities proportional to size measures (PPS). Stratification of facilities was by four geographic regions. In the first stage, a sample of facilities (Primary Sampling Units) was selected with PPS; in the second stage, interviewers visited selected facilities and chose a sample of inmates from their rosters using predetermined subsampling procedures. PSU's whose inmate counts were greater than 1,147 were designated as self-representing and included in the sample with certainty. PSU's whose inmate counts were 1,147 or less were designated as non-self-representing and combined with other such PSU's to form zones. A zone is a "cluster" of 1,170 inmates in the non-self-representing PSU's. The purposes of the zoning technique were to ensure constant interviewer workloads and to systematically select a sample with probabilities proportional to size measures. Zones were only utilized in computing estimates of variances and not in sampling.

The survey yielded 11,397 interviews of offenders housed in 215 state correctional facilities.

FILE STRUCTURE

The Survey of Inmates of State Correctional Facilities, 1979 is available from the ICPSR in two formats: card image and OSIRIS. The card image file contains several decks per case in a format based on 80 column punched cards. The data are sorted by case with all decks for a case together in ascending order.

The OSIRIS dictionary gives the format and other information for each variable in the OSIRIS data file. The dictionary or dictionary-codebook file is used in conjunction with the OSIRIS software package. The OSIRIS data file is constructed with a single logical record for each case. There are 993 variables on 11,397 cases.

The OSIRIS data file can be accessed directly through software packages or programs which do not use the OSIRIS dictionary by specifying the tape locations of the desired variables. These tape locations are given in the OSIRIS dictionary-codebook.

CODEBOOK INFORMATION

The example below is a reproduction of information appearing in the machine-readable codebook for a typical variable. The numbers in brackets do not appear but are references to the descriptions which follow this example.

```
.....................................................

[1] VAR 043      [2] DATE SENTENCED-YEAR  [3] MD=80 OR GE 98
    REF 043        [4] LOC 80   WIDTH 2  [5] DK   2 COL 18-19

   [6] Date sentence

   [7] Year
       ----------------------------------------

   [8] Actual number is coded.

      1  80.  Illegal entry
     87  98.  NA
   9689  99.  Out of universe

.....................................................
```

[1] Indicates the variable and reference numbers. A variable number and reference number are assigned to each variable in the data collection. In the present codebook, which documents the archived data collection these numbers are identical. Should the data be subset or rearranged by an OSIRIS program (e.g., MMP to intersperse data from another source, or TCOT to produce an analysis deck), the variable numbers would change to reflect the order of the new data collection, while the reference number would remain unchanged to reflect the variable number in the codebook describing the archived data collection.

[2] Indicates the abbreviated (24 character maximum) variable name used within OSIRIS to identify each variable for the user. An expanded version can be found in the variable description list.

[3] Indicates the designation of missing data. In this example, code values equal to 80 or greater than or equal to 98 are missing data (MD=80 OR GE 98). Alternative statements for other variables are "MD=0", "MD GE 9", or "NO MISSING DATA CODES". Some analysis software packages (including the ICPSR-supported package) require that certain types of data which the user desires to be excluded from analysis be designated as "MISSING DATA," e.g., inappropriate, unascertained, unascertainable, or ambiguous data categories. Although this value is defined as within the missing data category, this does not mean that users should not or cannot use this code value in a substantive role if they so desire.

[4] Indicates the starting location and width of this variable within the record when the data are stored on magnetic tape. In this example the variable named "DATE SENTENCED-YEAR" is 2 columns wide and located in the 80th column within the record.

[5] Indicates the location by deck and column(s) of this variable when the data are on cards or in a card-image format (either 80- or 84-column format)

[6] Indicates the full text (question) of the variable description supplied by the original collector of the data. The question text and the numbers and letters that may appear at the beginning reflect the original wording of the questionnaire item.

[7] Indicates an additional comment or explanation appended to the variable description.

[8] Indicates the variable has been declared continuous and the phrase "Actual number is coded." appears in the codebook. Can also indicate a variable which has a footnote associated with it. The variable is denoted by the message, "SEE NOTE(S) X" where X is the number of the footnote referenced.

[9] Indicates the frequency of occurrence of each code value. Frequencies inserted in this codebook are not weighted.

[10] Indicates the code values occurring in the data for this variable.

[11] Indicates the textual definitions of the codes. Abbreviations commonly used in the code definitions are "DK" (DO NOT KNOW), "NA" (NOT ASCERTAINED), and "INAP" (INAPPROPRIATE).

[12] Indicates the number of valid responses, the lowest coded response, the largest coded response, the mean, and the standard deviation.

ICPSR PROCESSING INFORMATION

The study was processed according to the standard ICPSR processing procedures. The data were checked for illegal or inconsistent code values which, when found, were recoded to OSIRIS missing data values. No consistency checks were performed. Statements bracketed in "<" and ">" signs in the body of the codebook were added by the processors for explanatory purposes.
